

# VC KeyLine key safes

For a smart, simple and secure handover of keys.

Until now, handing over vehicle keys was not very smart, but this is changing from now on. Thanks to our newly developed lockers and the appropriate software for key handover, keys and vehicles can be picked up and returned at any time 24/7. **The perfect solution for rental, service and test drives.**

## Safe and reliable

Metal construction, electronics, software security and overall reliability of the system - all this was taken into account in the new development. For smart key cabinets, security precautions against cyber attacks are an important issue in addition to topics such as mechanical burglary and theft protection. The latter is fulfilled by integration into the VC Cloud Core System. For a high level of system security, external penetration tests are carried out with various attack patterns.

## Elegant design

The new Variocube KeyLine has been redesigned from the ground up and at the same time relies on the proven hardware components that we have been using for years. The modern and elegant design consists of a combination of stainless steel, high-quality powder coating and ergonomic lines. Personalised branding of the KeyLine can be achieved through compartment inserts embroidered with your logo and a stainless steel base specially made for you. Show your brand in every detail and trigger a "wow effect" with your customers.

### High burglar resistance

Even when the drawer is open, several safety measures prevent the user from entering an adjacent compartment.

### Simple and safe processes

Thanks to our decades of experience in software development, the processes are clearly and intuitively designed.

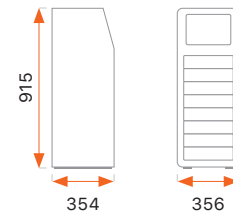

### Expandable as desired

If necessary, the capacity can be expanded at any time by means of extension modules.

## Technische Daten:

### Variocube KeyLine

Body	Galvanised sheet steel
Housing	KTL primed and MICA 618 coated
Drawers, front panel, pull-outs	Edelstahl geschliffen und gebürstet
Display	Stainless steel ground and brushed
Floor mounting	required
Temperaturbereich	-20 to +35 °C

#### DIMENSIONS (W x H x D) mm

<b>KeyLine Exterior</b>	356 x 916 x 354
<b>Drawer</b>	250 x 50 x 200

## How and where smart key safes are used:

### Key receiving and return for car dealerships and specialist workshops.

With smart key safes, vehicle keys can be handed in, collected or exchanged at any time of day. Your opening hours can be optimised and your service times can still be extended. Your customers book the service appointment incl. rental vehicle either by phone, e-mail or on your website. The vehicle can be brought in the day before, in the evening or after work. Customers can take the key of the rental vehicle and leave their own key in a safe place.

This saves the user time and allows them to use a service tailored to their needs. As an entrepreneur, you have the advantage that the vehicles are available first thing in the morning and workshop planning can be optimised. Nowadays, customers' most important asset is their time. Help them to save it.

### Handover of keys for rental vehicles.

Rental vehicle providers can flexibly extend service hours by using a smart key safe - including API integration into your rental platform. This enables vehicle rental at weekends or at night without high personnel costs.

One possible process: Vehicle keys and documents are permanently stored in the locker. The customer books a vehicle via your rental platform. He then only has to type in the booking code on the display and receives the corresponding key. At the same time, a handover protocol is stored on the server. If desired, a return can also be integrated into the process.
